

Loom Demo Script v2 — Marketing Intelligence ADK Agent

Pre-loaded Chat + One Live Demo

Total time: 2:00 - 2:30 minutes **Format:** Screen recording with voiceover, no face cam **Key change:** Chat is pre-loaded with 3-4 prompts BEFORE you hit record. You only type ONE live prompt during the video.

BEFORE YOU HIT RECORD (Setup — do this 5-10 min before)

Step 1: Open the Cloud Run UI

Open: <https://adk-default-service-name-778200673789.us-central1.run.app/dev-ui> Select [marketing-intel-...](#) from the dropdown. Click "+ New Session".

Step 2: Pre-load the chat with these prompts (send them one by one, wait for each response)

Prompt 1:

How many sessions and purchases were there in January 2021?

Wait for response (should say 116,549 sessions, 1,204 purchases).

Prompt 2:

Give me a marketing performance briefing for January 2021. Break down sessions, purchases, and revenue by traffic source. Flag any anomalies.

Wait for full briefing response (this is the big one with executive summary, insights, anomalies).

Prompt 3:

Which traffic source had the highest conversion rate and why?

Wait for response.

Step 3: Scroll to the TOP of the chat

Scroll all the way up so Prompt 1 is visible at the top.

Step 4: Open a second tab

Open: <https://github.com/mufibra23/marketing-intel-adk>

Step 5: Go full screen

Press F11 for clean full-screen browser. Close all notifications.

Step 6: Have this script on your phone

Now hit record on Loom (screen only, no face cam).

THE SCRIPT (Shot by Shot)

[0:00 - 0:10] THE HOOK — Start on the Cloud Run tab, chat visible at top

Screen shows: The ADK chat with the first prompt visible at the top **Your cursor:** Don't move it **Say:**

"Marketing teams spend hours every day pulling reports and checking dashboards. I built an agent that does it in seconds. Let me walk you through it."

[0:10 - 0:25] SCROLL THROUGH PROMPT 1

Your cursor: Scroll down slowly to show the first prompt and response **The screen shows:** "How many sessions and purchases..." → execute_sql tool calls → "116,549 sessions, 1,204 purchases" **Say:**

"Here I asked a simple question — how many sessions and purchases in January. The agent connected to BigQuery through MCP, ran the SQL query autonomously, and returned the answer. 116 thousand sessions, 1,200 purchases."

Cursor: Briefly hover over the execute_sql badges on the left to draw attention to the MCP tool calls

[0:25 - 1:10] SCROLL THROUGH PROMPT 2 — The Money Shot

Your cursor: Keep scrolling down to the big briefing prompt and response **Say (as you reach the prompt):**

"Then I asked for a full marketing briefing. One prompt."

Now scroll through the briefing response SLOWLY. Pause 3 seconds on each section:

1. **Pause on Executive Summary**

"It generated an executive summary with the key numbers."

2. **Scroll to Top 3 Insights — pause**

"Top three insights ranked by business impact — organic search leading in sessions, direct traffic showing strong brand loyalty, high-value referral sources identified."

3. **Scroll to Anomaly Alerts — pause**

| "And anomaly detection — specific dates flagged where metrics changed more than 20 percent, with recommended actions for each one."

[1:10 - 1:25] SCROLL THROUGH PROMPT 3

Your cursor: Scroll to the conversion rate question and response **Say:**

| "It can also answer follow-up questions in context. Here I asked which traffic source converts best — and it analyzed the data and explained why."

[1:25 - 1:45] ONE LIVE PROMPT — Prove it's real-time

Your cursor: Click the message box **Type (at normal speed):**

What day in January had the biggest revenue drop and what likely caused it?

Say while typing:

| "And this is live — let me ask a new question right now."

Press Enter. While waiting (10-15 seconds):

| "You can see the agent calling BigQuery through MCP in real time — deciding what SQL to write, executing the query, analyzing the results."

When response appears:

| "There it is. A specific answer with data to back it up."

Your cursor: Don't scroll away. Let judges read for 3 seconds.

[1:45 - 2:10] ARCHITECTURE — Switch to GitHub tab

Your cursor: Click on the GitHub tab **Say:**

"The architecture — this is built with Google's Agent Development Kit, ADK, using Gemini 2.5 Flash for reasoning. It connects to BigQuery through the Model Context Protocol — MCP — which separates AI reasoning from data access. The whole thing is deployed serverless on Cloud Run. What you just saw was the live deployment."

Your cursor: Scroll to the Architecture and Tech Stack sections in the README. Pause there briefly.

[2:10 - 2:20] CLOSE — Switch back to Cloud Run tab

Your cursor: Click back to the Cloud Run tab showing the chat **Say:**

"One prompt, full marketing intelligence. ADK, MCP, BigQuery, Cloud Run. Open source on GitHub. Thanks for watching."

Your cursor: Stop. Let the screen sit for 3 seconds. Stop recording.

KEY RULES

1. **Never apologize.** No "this is a prototype" or "it's a bit slow" — present with confidence.
2. **If the live prompt is slow,** fill the silence by narrating the tool calls appearing on the left panel. That IS the demo.
3. **Scroll slowly.** Judges need to read. If you scroll fast they miss the impressive parts.
4. **Speak at 80% of your normal speed.** Judges may not be native English speakers.
5. **The pre-loaded chat is 80% of the video.** The one live prompt is just to prove it's real. Don't stress about load time.

6. **End on the chat, not on GitHub.** The last frame should be the impressive agent responses, not code.
